

# Release Notes 2008-09-28

Config db ntf: 20080928185500  
 Analyze db ntf: 20080811172500  
 Windows Version: 1.5.15.260 :: MAC OS X Version: :: Linux Version:  
 Eclipse Plugin:

## Major Improvements: Various fixes

Configuration Database	
FIX	Fixed a problem with online update introduced in the previous release - customers that have a problem with online update can fix this problem through either of the following two approaches: EITHER.) download the configuration database template from <a href="http://www.panagenda.com/mclit/templates/panagenda.ntf">http://www.panagenda.com/mclit/templates/panagenda.ntf</a> and apply the update through a design replace (recommended over a design refresh) OR.) open the script library "Online Update" in the configuration database in designer, open function "MyInternetGetFile" and search for the THREE occurrences of [sServerName+":80"] (without the brackets!), and replace ALL THREE occurrences with [sServerName+"] (again, without the brackets)
FIX	Pasting link data from clipboard or database catalog previously did not support *IX environments with paths that contained a "/" instead of "\"
FIX	Fixed a problem with managing "local primary names" and "bookmark database" from desktop icon action - the corresponding references were not rendered into the action xml properly; requires resave of respective icon action documents
FIX	Previously, upon initial creation, file deployment document rendered an incorrect action xml, causing the deployment to fail (after an additional subsequent save of the document, file deployment worked just fine); deployment actions now work immediately upon creation
FIX	Fixed a problem with location management actions: previously, change only and removal of locations containing a "(" or ")" did not work - the location names were not escaped in the resulting xml (workaround for previous releases was to enter ( and ) with a prefix \--> \(, \) - add, add/change worked just fine with brackets ( )
FIX	Connection management actions now properly set the field "only for user"
FIX	Fixed a problem with prohibit design refresh for shared image resource "database_icon.gif" - this requires a design replace instead of a design refresh
FIX	Fixed the server tab in location management to not show for management of locations of type "no connection"
FIX	The bookmark folder property section in bookmark actions was previously displayed even if both found & not found action were "nothing"
FIX	Removed the previously wrongly displayed "restrict to users with certain mailservers only" section for realtime actions
FIX	The bookmark action xml in a desktop icon action using a bookmark template was displayed regardless of role [XML]; This is now properly displayed for users with role [XML] only
CHANGE	Changed priority range for "notes.ini & variables" action to allow for such actions to run before or after any other action(s)
CHANGE	Changed the default priority for bookmark folders; previously a bookmark folder was potentially created after a bookmark wanted to be added to it
ENHANCEMENT	Replica ID fields in mass change, desktop icon, and bookmark management actions now allow for the use of references (e.g. <notes:um_replicaid> or <notes:names_replicaid>)
Analyze Database	
- No changes -	- No changes -
.DLL Updates (Windows)	
NOTE	MC_NetworkDirectory supports the same placeholders as MC_WorkingDirectory (e.g. %os_user%)
FIX	Fixed a problem where MarvelClient would not run on Notes release 5 (introduced in 1.5.8.241)
FIX	Unmerge in notes.ini & variables management actions now works - NOTE that this requires a resave of any ini management action that use Unmerge!

FIX	In previous releases, switching user names during login did not have any effect on the actions.xml used Now, MC_WorkingDirectory can be configured to also include %notes_user% to separate working directories for multiple notes users on one Notes client NOTE THAT BEFORE LOGIN, synchronisation occurs based on the PREVIOUS user logged on the the machine (Unknown/Unknown upon initial setup)
FIX / CHANGE	backup sets uploaded into a Domino database were previously uploaded by key on a case sensitive basis; this has been changed to case-insensitive
CHANGE	Fixed a problem with icon actions failing that were associated to multiple workspace page documents out of which one or more were not visible to user
ENHANCEMENT	MC_AllowSyncDuringSetup=2 previously only checked for KeyFileName= in notes.ini and existence of the there specified ID file. now, if KeyFileName is not specified, MarvelClient searches notes.ini for ConfigFile= and checks the thereby referenced (setup) config file for an entry KeyFileName= and if found, checks whether the there specified ID file exists
ENHANCEMENT	Added replica id info of bookmark.nsf and primary local names to config.xml (<notes:bookmark_replicaid> and <notes:names_replicaid>)
ENHANCEMENT	Added current location name to config.xml (<notes:location>)
<b>.dylib Updates (Mac OS X)</b>
