

MC Config - 20190821083600

This component release is part of [MarvelClient 10.1](#)

ENHANCEMENT	Improved UI performance in all actions to make them open and save faster.
ENHANCEMENT / NEW	MCUpgrade Configuration: If you select "run via your own solution" on the Elevation tab, you now also have the option of performing whitelisting.
ENHANCEMENT / NEW	MCUpgrade Configuration: Added a new option next to the "Prepare or Publish Upgrade" button: "Always use latest MCUpgrade files and license". By default, this option is checked to ensure that the most recent files are used. NOTE: This option is only visible in advanced mode or when unchecked. It should be manually enabled in older configurations in almost all cases.
CHANGE / ENHANCEMENT	MCUpgrade Configuration: Added a new option "Also run upgrade during client shutdown if ready" on the user experience tab. In existing upgrade configuration this is enabled for compatibility reasons; in new upgrade configurations it is disabled by default. The reason for not wanting to run upgrades during client shutdown is that end users often shut down Windows right afterwards, causing the upgrade to be interrupted or fail.
FIX	Fixed an issue in MCUpgrade configurations where the option "Run Upgrade only if client is older than the following release ..." did not properly match Notes versions in some cases.
FIX	Fixed an issue in MCUpgrade configurations where the configured conditions were not applied on the first save - they were requiring a second document refresh to work.
CHANGE / ENHANCEMENT	Newly created DLL Update actions will now put the (p)mc.dll by default in the data directory.
CHANGE / ENHANCEMENT	Essentials binaries deployed to the Data directory via Mailbased Install will now have filenames that include "_data" at the end. This helps prevent issues where the wrong Essentials binary gets loaded.
FIX	Fixed an issue in OnlineUpdate where the available languages were not properly displayed (it only showed the language code).
FIX	Fixed an issue where OnlineUpdate would not properly validate the MCUpgrade license key, allowing the start of an update with an empty field leading to an error.
FIX	Fixed an issue in the Automate Cleanup action where the source database selection would not allow to specify additional databases in some situations.
