

Release Channels

We operate on three release channels: Internal, Stable, and Public.

All customers are on the Public channel. They can request individual Stable releases if they want them.

- [Internal](#)
- [Stable](#)
- [Public](#)

Internal

- Can contain test or debug builds, generally for internal testing only.
- Is only made available to select customers when necessary (critical fixes for customer-specific issues that cannot wait until they hit stable).
- Will only show up in release notes when issued to customers.

Stable

- No predetermined frequency, but we regularly set Internal releases to Stable when they are mature enough (about monthly).
- Made available to customers when needed or requested; always made available to partners.
- Check the release notes and contact support@panagenda.com (or the panagenda partner you are working with) to get issued a Stable release you want.

Public

- Selected from releases that have been Stable for a while and have been in use successfully at several customers.
- Updated semi-annually (twice a year), more often if needed.
- Get issued to all customers in maintenance.

We have set up a page to easily track [releases added to the Public channel](#).
