

Release Notes 2009-11-08

Config db ntf: 20091108152500
 Analyze db ntf: 20091108152500
 Windows Version: 1.9.1 :: MAC OS X Version: 1.9.10 :: Linux Version: 1.7.19
 Eclipse Plugin:

Major Improvements: Added various new references (config details), 8.5.1 compatibility, Corrected mailbased install result, Failsave DLL update for future Notes releases, PKCS12 Export feature for ID files, Various fixes

Configuration Database	
FIX	Fixed a problem where exclude actions did not work if the title of the action contained any of the characters <, >, &, ", or '
FIX	Fixed a problem where Mailbased installs were reported successful even if the DLL could not be extracted/detached/saved - such install reports are now properly reported as failed
CHANGE	The navigation page has been changed slightly by moving Integration options to the bottom
CHANGE	Previously, if the DLL could not be detached during mailbased install because an existing DLL could not be overwritten, install was reported successful - now such install reports are titled "Partly successful".
CHANGE	Changed the behaviour of the priority field for all actions: previously, each action type had its own base priority and range. Priorities could only be entered within the respective range, optionally being larger than max but not lower than min (base). Entered priorities were added to invisible base priorities. The new behaviour is to accept any number between 0 and 4,199,999,999 with the recommended priority range displayed. If the specified priority is outside of the recommend range, a warning is displayed (every time) when saving the document.
ENHANCEMENT	The following options have been added to Mailbased Install: + only run install on a specific platform (Windows, Linux, or Macintosh) + prevent install attempt on Citrix + run install for mailfile owner only
ENHANCEMENT	The enduser name and Notes release have been added to Mailbased install reports
Analyze Database	
FIX	Fixed a problem with improper rendering of the file overview table in upload documents with revision depth > 1
FIX	Updated the Export ID File action in analyze database, requires role [Security] therein - then available from view Users\by State & Upd.Key; for further information regarding decrypting collected ID files, see Administration\ID-File Export Config in Analyze database)
.DLL Updates (Windows)	
NEW	<alias:replica_path> now allows for referencing the path of the local replica (if applicable) for a desktop icon action
NEW	Added various new variables to config.xml, e.g. memory details, mouse, monitor, and others.
NEW	Added notes.ini option MC_AllowSyncDuringSetup_FixPrompt=1 - if so set, initial client setup will not prompt for a password twice
NEW	Optional update of actions.xml at client shutdown by setting mc:viewreader_shutdown_enabled (boolean; accepts true,false,yes,no,1,0)
FIX	If Notes was upgraded to 8.5.1 prior to switching to at least 1.8.12, automatic in-place DLL update could not update the DLL as older DLL versions do not support 8.5.1 The DLL architecture has now been changed to also run DLL updates even if the Notes release is not yet supported.
FIX	Fixed a problem in Notes 8.5, where changing desktop and/or bookmark links did not seem to work (whilst MC did work, Notes did not want to pick up the changes properly) - this update has Notes 8 refresh its configuration properly now.
FIX	Customers running IBM Lotus Notes 8.5 on Windows Vista had reported issues with nfileret and MarvelClient - this issue is now fixed.
FIX	Fixed a problem with checking for free disk space when creating a new local replica from desktop icon action
FIX	Fixed a problem where automatic creation of local personal addressbook ("names.nsf") failed if missing
FIX	Fixed the problem that enforcing the path for a local replica did not check whether the new path was sane (e.g. available, enough space, ...) - the local path will now only be enforced if the new path is available and has enough disk space.
FIX	Fixed a problem where purging of softdeleted location documents during client startup would crash Notes
FIX	Fixed a focus problem that prevented drag&drop from Notes to Windows for encrypted archives

FIX	MarvelZip previously ignored encryption strength setting in File-Attach dialog - now, Standard encryption leads to AES 128bit and Strong to AES 256bit encryption
CHANGE	Due to this fix (previous line), the default encryption has been changed to low in order to ensure Windows compatibility
CHANGE	log.xml now logs time elapsed as readable numbers rather than scientific
FIX /CHANGE	Automatic creation of names and bookmark databases now also copies documents from templates along
ENHANCEMENT	DLL now supports IBM Lotus Notes 8.5.1
ENHANCEMENT	The PKCS12 export option in the new Tasks\JID. ID-File action now works/is now supported. (= PKCS12 Export of Certificates from inside ID files and saving them to an AES encrypted file / backing them up to a Domino database; includes new decryption action in Analyze database, requires role [Security] therein - then available from view Users\by State & Upl.Key; for further information regarding decrypting collected ID files, see Administration\ID-File Export Config in Analyze database)
ENHANCEMENT	References to non-existing config values now create more meaningful log output
.dylib Updates (Mac OS X)	
- No changes -	- No changes -
.so Updates (Linux)	
- No changes -	- No changes -
