

How to trigger a sensor manually

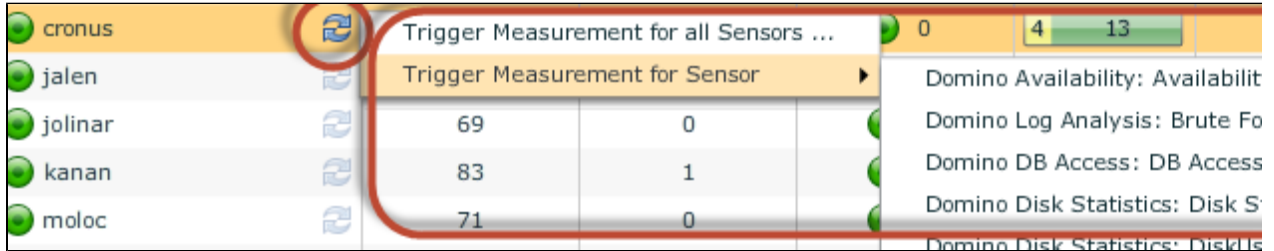

Introduction

This example shows you how to execute a sensor manually. This function has been introduced with GreenLight Version 2.9.5.

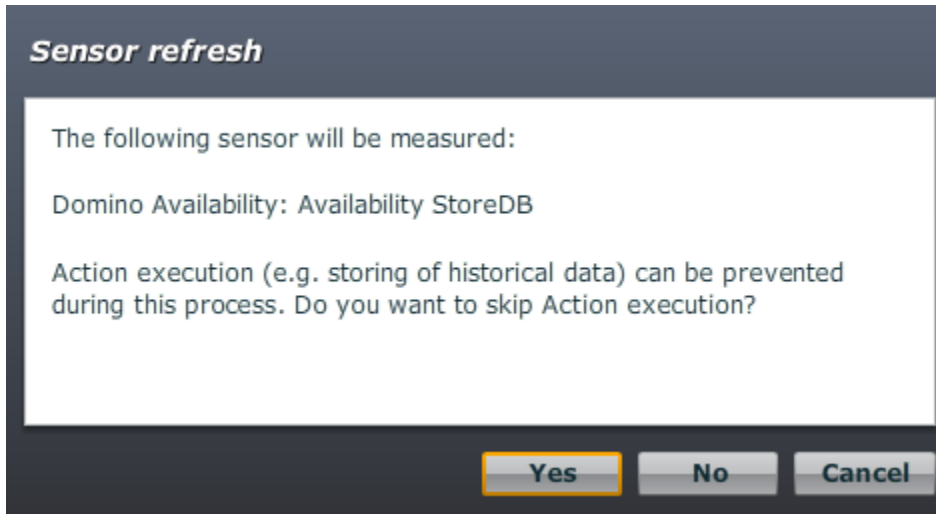

Example

Configuration

On the Live Monitor - Health Grid or Sensor Overview Tab you see now a "refresh icon" next to the server name. Whenever you click on it, you can choose to run all or individual sensors.

Afterwards the following message box appears asking you, if you want to execute the ACTIONS which are assigned to each of the sensors (for instance: mail notification , ...)

If you click "NO" , all Actions are executed in case the conditions within the action is met!

Conclusion

Now you have the chance to execute a sensor without waiting for the next measurement cycle.
