Release Notes v1.2.5

New panagenda DataMiner Features

- **Use HTTP Header variables in queries**
  Queries, called via the DataMiner WEB API, can now include HTTP Header variables send by the calling web client. All header variables are rendered into the system, named:
  `HTTP_HEADER_<headername in camelcase>.`
- **New, aditional template language**
  Queries now support, in addition to the current template language (:<name>), a new template language.
  The new template system is based on the lodash template functions. How to use these templates and variables can be found here:
  https://lodash.com/docs/4.17.5#template

Bug Fixes

- An error, where the query id was lost when opening an DM internal link while being unautheticated, was fixed.
- An error, where it was impossible to call an query with the external web API, was fixed.
