

Action for PerformanceCounter

You may have the situation that you wanna monitor processes on a windows host. For example a process like e.g. winlogon.exe

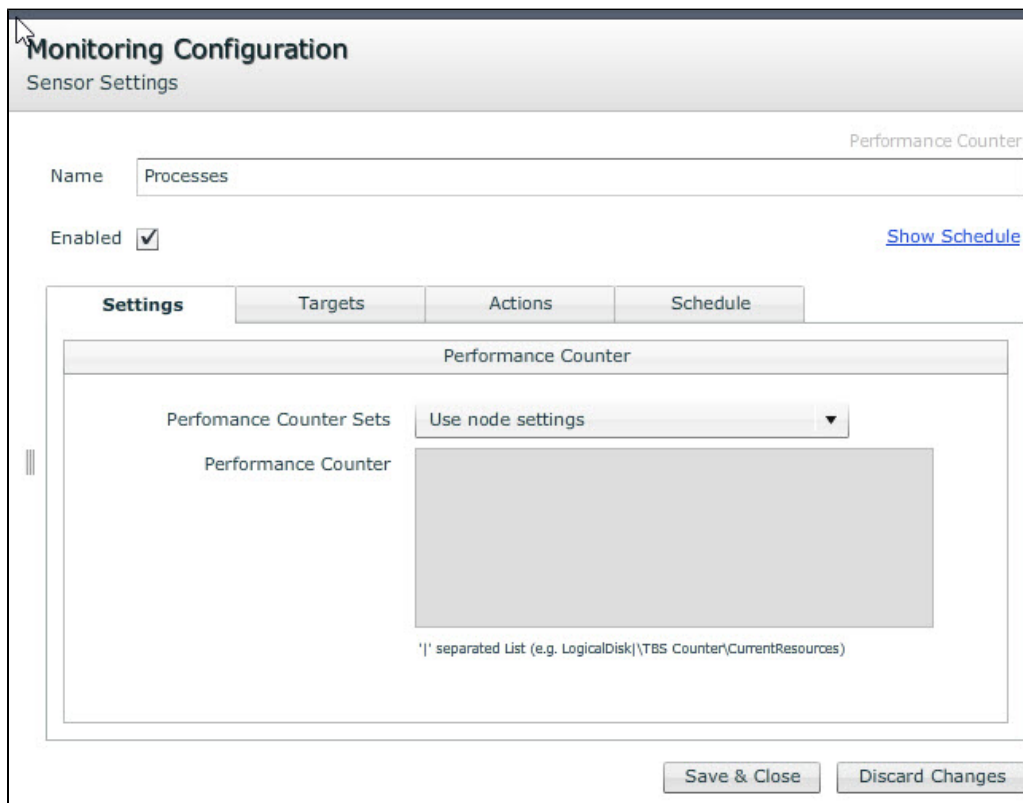

This kbase article explains a very simple usecase where you want to get notified whenever this process is gone/crashed/disappeared.

Configuration

- Open the Windows Host in GL and click on Load Counter (make sure you have assigned the right Authentication Profile)
- drag'n'drop the Process Category to the right and save/close

- create a Performance Counter Sensor and assign the correct host
- leave the Settings

- Add an action and copy/paste the following condition string
`${str:contains(result.details,'greenlight.perfcounter.counter.process(winlogon).elapsed_time')==false}`

whenever the process is gone, this perfcounter key does not exist anylonger this condition becomes true ad fires off the notification

- Add a notification text
for instance:

Winlogon Process on `$(gl:commonName(config.nodeDefinition.name))` is NOT running!

save/close

DONE

Conclusion

from now on you get notified whenever the winlogon process is gone 😊
