# Release Notes v3.5.2

This is a a bug fix and improvement version

## Improvement

- **Sensor configuration**

  Sometimes opening a sensor configuration took an unusual amount of time. This has been improved now so that every sensor configuration opens up in few seconds

- **Update**

  The manual Update Process link has been removed. In future releases the upgrade can only be triggered via the ssh console instead of via the webbrowser.
  This has been done in order to have the same upgrade process in place across all panagenda products.

- **Action Conditions**

  We have added a context menu into thes Statistics tab of a sensor result set(see screenshot) which you then can copy/paste it into an action condition.

## Bug Fix

- **General**

  Fixed an issue where User configurations and Chart definitions have not been saved successful.

- **Platform**

  Clean core files on notes volume

  pgdata has been added to cron container
