

Release Notes v1.1.0

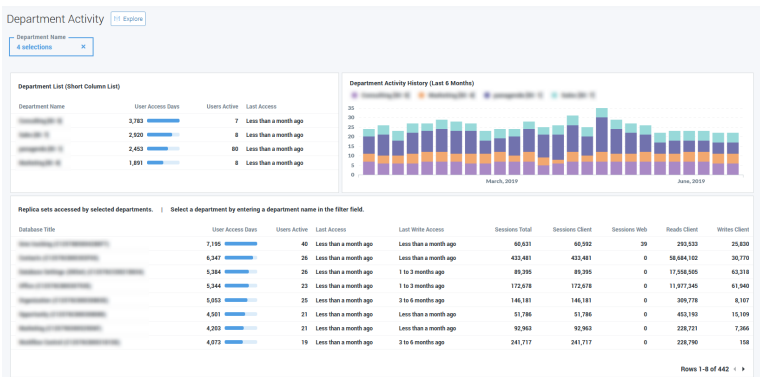

panagenda is proud to announce this new release of iDNA Applications. Whether you're modernizing or migrating Notes/Domino, iDNA gives you the knowledge to deliver the most difficult projects efficiently, on time and on budget. This new version brings a lot of value with many new features, improvements and bug fixes.

Highlights

Department & Location Activity

These new dashboards make it easier than ever to find out about department and location activity. See which applications they accessed when and how many users were active.

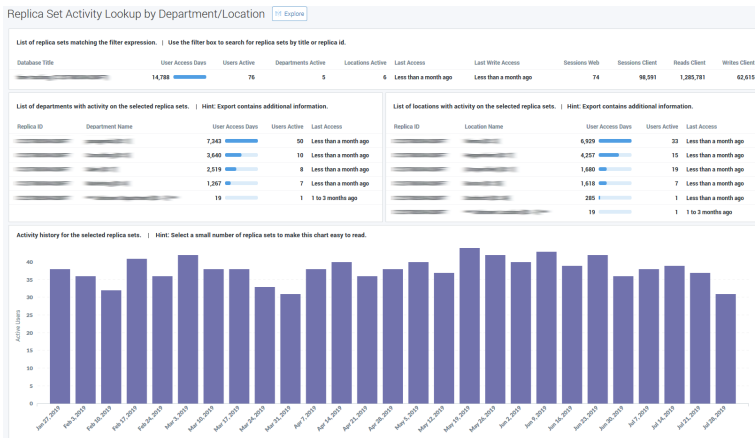

Department Activity Dashboard

Identifying Application Owners

Similar to looking up activity by department, we have also added the capability to drill down into activity by user and replica set:

- Enter a part of a username to search for matching users to see their activity history and which apps they accessed.
- Enter a part of a database title or Replica ID to see which users and departments/locations are active

Activity Lookup by Replica Set

This feature is especially useful when trying to identify application owners or responsible cost centers.

Replica Set Catalog

Where previously a detailed catalog view only existed for database instances, a fully featured grid is now available for replica sets as well.

Applications™ [Search...](#)

Replica Sets

Search in all fields... FILTER Default CSV EXCEL

Title	Replica ID	DB Type	Remediation Classification	Usage Overview	Usage Categorization
...	...	Application	Expert Opinion	Jun 13, 2019	Medium
...	...	Application	Consolidation Potential	Jul 11, 2019	Very Low
...	...	Application	Consolidation Potential		No Usage
...	...	Application	Quick Win Candidate	Jun 13, 2019	Medium
...	...	Application	Quick Win Candidate	Jun 13, 2019	Low
...	...	Application	Quick Win Candidate	Jun 13, 2019	Medium
...	...	Application	Expert Opinion	Jun 13, 2019	Medium

Replica Set Catalog

This new list contains over 150 columns around:

- Usage
- Design
- Source code
- Replication consistency
- Similarity
- ...

New Features

Controlling what is considered a Focus DB

After some much appreciated feedback from customers and partners, we have added this new feature which gives control over database type categorization. The main use case here is being able to determine what is counted as Focus DBs and what is not. This was previously done automatically and could not be changed.

See this [knowledge base article on the topic](#) for more detailed information.

More granularity in Domlog collection configuration

Web logs have always been a heavy hitter when it comes to disk usage. With this new feature we allow some granularity around what is being collected from Domlog and how many details are actually stored in our data warehouse.

Default Configuration Change

From this version going forward, iDNA Applications will use new default configuration settings for Domlog collection. The new settings will reduce disk usage caused by Domlog by over 50% in most customer environments. As a trade-off some limitations now apply:

- Cookie and Referer information will not be available anymore in raw data. Since it was not used for data processing previously, no negative impact should be noticeable.
- Web log lines in the 3xx range (redirects) are not stored anymore in raw data. This should not have an impact on the main data points (e.g. number of sessions or bytes up/down), but will be visible in secondary data points (e.g. count of requests).

The old default settings can be restored using the settings described in the [knowledge base article on the topic](#).

Improvements

Data Export: Titles in CSV and Excel exports are now "flattened" if they are displayed in multiple levels in the originating grid. This will make it considerably easier and more comfortable to work with Excel exports.

Database Catalog: The default on-click behavior has changed. Where it previously opened the database details it now selects the clicked row and column. Opening database details is now achieved via clicking the title. The database details will then be opened in a separate browser tab.

Grid Interaction: Usability of grids throughout the solutions has been improved. It is now easier to select multiple lines to export or copy content to the clipboard.

System Template Detection: The flexibility of system template detection rules has been extended to include more variants of standard template names that would have previously counted as applications.

Usage Dashboard Performance: Several data queries behind usage dashboards have been materialized to significantly improve performance in larger environments.

Usage KPIs: A new dashboard "Usage Category KPIs" has been added that gives insight on why applications are assigned their usage categories and provides additional KPIs on the apps in these categories.

Usage Overview Dashboard: Drill-downs have been improved by adding certain key fields to foundation level data rows that allow easier identification of database instances and replica sets without the need for additional joins.

Bug Fixes

Content Search: Content search would sometimes fail to display matching content due to a timing issue in communication.

Data Purging: The data purging algorithm has been improved. Previously, purging DWH data could lead to very long processing times in the following nightly DWH processing.

Database Inventory: The usage by database type table will now consistently display "0" values instead of a mix of "0" and "-".

Department Detection: An issue was resolved that would lead to inconsistent results if department/location source field configuration was changed after data had already been collected.

Language Change: An issue has been resolved that would lead to an error if the UI language was changed multiple times in rapid intervals.

Log Download: The process of downloading log files has been simplified and an issue with certain older browsers has been fixed.

Pseudonymization: In rare situations, department and location names could be re-engineered even though they were obfuscated.

Session Timeouts: Timeouts for the reverse proxy have been increased, to allow for long running queries in DataMiner.

Similarity Clusters: The UI will now properly display and calculate if a custom similarity threshold is configured.

Usage Overview Dashboard: An issue was fixed where the app history chart would show the first N weeks instead of the last.

User Name Format: Notes user names are now consistently un-canonicalized before being displayed in dashboards.

Structural Changes / Upgrade Path

Data Warehouse Rebuild Required

DWH Rebuild Required

After installing the update, parts of the application may not be available until the data warehouse is rebuilt. This process runs automatically at night, but can be triggered manually after the update. On the first login after the installation, more information on this topic will be displayed, along with the option to trigger the rebuild.

Upgrade Procedure: Container Installer

Details on how to update to this new version can be found in the knowledge base article [Upgrading iDNA Applications](#).
