MC Config - 20200505113400

ⓘ This component release is part of MarvelClient 11.0

FIX / CHANGE	In DLL Update actions, the flag "Only execute this update for existing MarvelClient Essentials installations" had no effect. Essentials DLL Updates would always only run on MC Essentials clients. This old setting has now been removed, and instead there is a new setting to allow a switch from full MarvelClient to Essentials (off by default).
FIX	Fixed an issue in the "Collect Mail Archive Details" agent, where it could not find the local names.nsf. This would happen in cases where the mail archive was enabled by Domino Policies.
CHANGE	In the Cloud Migration Preparation action, the setting to create a Connection document is no longer enabled by default.
NEW	Added new role [DebugRuntypes] to make all runtypes available for all action types in the UI. Normally, each action will have only the runtypes selectable that it supports. With this role set, an admin will be able to select any runtype for any action in the UI. Note: This allows admins to select runtypes that might not be supported in the DLL. Which at best means that actions will not run, and at worst can lead to crashes. So use this role with care.

MC Upgrade-related Changes

FIX	Fixed an issue where publishing Upgrades would fail with "error 13 in line 49".
