Design Complexity Ruleset

To be able to give insight into the complexity of an application, weighted rulesets are defined for panagenda iDNA Applications. These are based on our experience with analyzing database designs for modernization.

The following rulesets are provided:

- Web Design
- Specific Code findings
- Mail Dependencies
- Operating System Dependencies
- Special Interfaces
- IBM Cloud Readiness
- Dependencies on other Databases

If your organization requires additional custom rulesets, you can create your own through the Custom Insights section. See Building your own Custom Insights on details how to use this.
