Enabling MarvelClient Essentials from the Domino Directory
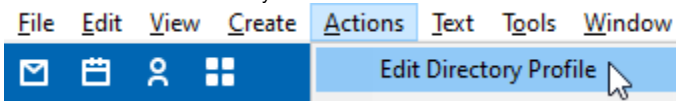

> ⚠ **IMPORTANT**
>
> If you already have a MarvelClient installation, you are advised to **not** enable MarvelClient Essentials.

Beginning with Notes and Domino V12, customers can easily enable MarvelClient Essentials as follows:

1. Open your HCL Domino Directory (public names.nsf) on any server of choice with Domino V12 or newer, and on which the public addressbook has the latest design

2. Click on Actions\Edit Directory Profile:

3. In the corresponding Domino Directory Profile, you can configure the enabled or disabled state of MarvelClient Essentials as follows:

Leave as is (default) to retain the current state.
This is useful if you already have MarvelClient and don't want to change anything, or if you intend to only deploy Essentials to a subset of users.

Enable to turn on MarvelClient Essentials on all Notes clients on the next start.
This will add "pmc.dll/dylib" to the notes.ini EXTMGR_Addins entry of all clients.

Disable to turn off MarvelClient Essentials on all Notes clients on the next start.
This will remove "pmc.dll/dylib" from the notes.ini EXTMGR_Addins entry of all clients.
