Creating Cinema Resources

For the time being, creating a Cinema Resource is mostly useful for embedding videos into your Cinema Slide Deck.

You can attach any resource (e.g. large animated images, videos or similar) to a Cinema Resouce document.

From within any Cinema Slide, you can embed a video, the resulting HTML code looks as follows:

[<video id="myVideo" autoplay muted width="560" height="315"> <source src="HCL Domino v12 is Coming.mp4" type="video/mp4"> </video>]

The source filename and type (mp4 or ogg) depend on the provided video resource.

Similarly, you can also embedd a video from an internal web server as follows:

[<video id="myVideo" autoplay muted width="560" height="315"> <source src="https://yourwebserver.fdqn/path/HCL Domino v12 is Coming.mp4" type="video/mp4"> </video>]

NOTE: Any src= reference in the converted HTML code is checked for whether it points to a Cinema Resource (supporting src=filename and src="filename"!)

If a referenced cinema resource is found, it is added to MCUpgrade.zip automatically, as well as to Slide Deck previews.
