

Release Notes v2.2.0

panagenda is proud to announce this new release of iDNA Applications. Whether you're in a Notes/Domino modernization or migration project, iDNA gives you the knowledge to deliver the most difficult projects efficiently, on time and on budget. This new version is mainly a maintenance release, but brings a lot of value with new features, improvements and bug fixes.

IMPORTANT Given the recent vulnerabilities created all over the IT world and the subsequent library updates that were necessary to address these issues, we would like to remind all our customers to apply a foundation of security and safety measures when using our virtual appliances.

A simple and short but important list of boxes to check:

- **Enable automatic Linux package updates (at least security fixes)**
- Change default password for Linux root user
- Change default password for Web config user
- Change default password for VNC Server connections

We provide our appliances with root access to make it easy to apply and adhere to your company's security policies for e.g. password quality, retention, etc. We strongly urge you to implement these guidelines. Not only vulnerabilities that make the news can pose a significant security threat.

Highlights

Mail Reporting

An extensive set of reports around the topic of mail routing is now available in Metabase. A Beta version of these reports has been introduced in a previous version, but with v2.2, the functionality goes Gold. iDNA Applications is now able to collect and process Mail Routing Event data from Domino's log.nsf.

Topics included are:

- Mail traffic history
- Inbound/Outbound mail statistics
- Mail recipient/size distributions
- Traffic by business hours
- Volume between departments

- Traffic per external mail domain

This set of features is not included in iDNA Applications standard license. Please contact sales@panagenda.com for details on how to get started with mail reporting in your environment.

New Features

Group Analytics: Groups and group members are now available in the `cxq_data` schema.

Bug Fixes

Update UI: An issue has been fixed where localization for the "A new version is available" dialog would in certain cases fail to load texts properly.

Structural Changes / Upgrade Path

Data Warehouse Rebuild Required

DWH Rebuild Required

After installing the update, parts of the application may not be available until the data warehouse is rebuilt. This process runs automatically at night, but can be triggered manually after the update. On the first login after the installation, more information on this topic will be displayed, along with the option to trigger the rebuild.

Upgrade Procedure: Container Installer

Details on how to update to this new version can be found in the knowledge base article [Upgrading iDNA Applications](#).
