

Sametime Community Statistics

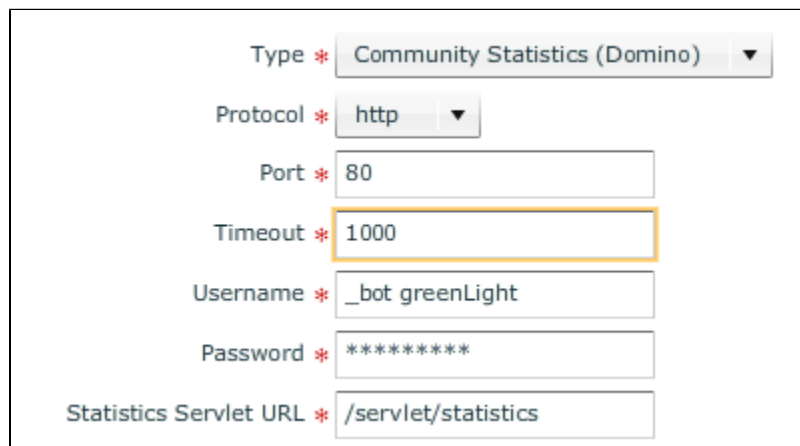

Overview

Retrieving Sametime Community Statistics helps you do understand how heavily (or not heavily 😊) your IM Infrastructure is used

Sensor Configuration

Whenever you start configuring the "Sametime Meeting Statistics" Sensor, you need to set the following

- Protocol
- Port (Soap port number of the STMeeting Server)
- Credentials
- URL --> this is the default servlet url

The screenshot shows a configuration form for the "Community Statistics (Domino)" sensor. The fields are as follows:

Field	Value
Type *	Community Statistics (Domino)
Protocol *	http
Port *	80
Timeout *	1000
Username *	_bot greenLight
Password *	*****
Statistics Servlet URL *	/servlet/statistics

Requirements

Make sure that the user account which is used in above configuration, has the "SametimeMonitor" Role in the Sametime Configuration DB (stconfig.nsf) assigned.

--> this role points to the default configuration for the servlet

Output

The result of the measurement run is a very long list of Community Statistics

e.g.

	Key	
★	AverageFileTransferSize	0
★	AverageFileTransferSizeInInterval	0
★	AverageFileTransferTime	0
★	AvgConcurrentLoggedInUsers	3
★	AvaConcurrentLogins	3
